计算机网络实验报告 (二)

专业: 计算机科学与技术

学号: 2011188 姓名: 邵琦

- 一、实验要求
 - 。 具体要求:
- 二、实验设计
 - 。 2.1 建立连接&断开连接
 - 三次握手建立连接
 - 四次挥手断开连接
 - 。 2.2 数据传输
- 三、代码实现
 - 。 3.1 报文格式
 - 。 3.2 计算校验和
 - 发送方生成检验和
 - 接收方校验检验和
 - 3.3 建立连接(三次握手)
 - 服务器端
 - 客户端
 - 。 3.4 断开连接 (四次挥手)
 - 服务器端
 - 客户端
 - 。 3.5 数据传输
 - 服务器端 (接收)
 - 客户端 (发送)
 - 发送单个数据包
 - 发送文件
- 四、实验结果
 - 。 4.1 三次挥手建立连接
 - 。 4.2 数据传输
 - 。 4.3 四次挥手断开连接

一、实验要求

基于UDP服务设计可靠传输协议并编程实现(1)

利用数据报套接字在用户空间实现面向连接的可靠数据传输,功能包括:建立连接、差错检测、确认重传等。流量控制采用停等机制,完成给定测试文件的传输。

具体要求:

- 1. 实现单向传输。
- 2. 对于每一个任务要求给出详细的协议设计。
- 3. 给出实现的拥塞控制算法的原理说明。
- 4. 完成给定测试文件的传输,显示传输时间和平均吞吐率。
- 5. 性能测试指标:吞吐率、时延,给出图形结果并进行分析。
- 6. 完成详细的实验报告(每个任务完成一份)。
- 7. 编写的程序应结构清晰, 具有较好的可读性。
- 8. 提交程序源码和实验报告。

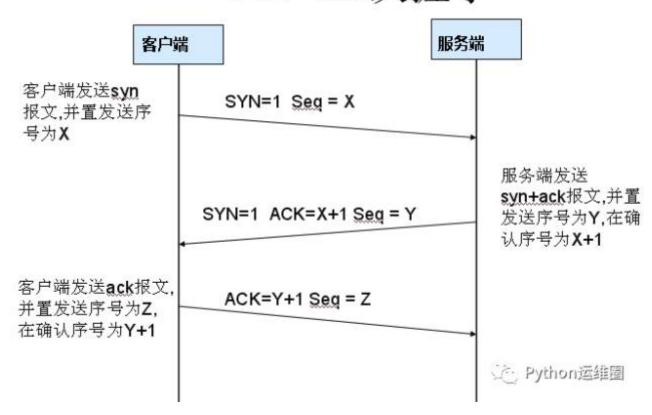

二、实验设计

2.1 建立连接&断开连接

三次握手建立连接

- 1. 第一次握手:客户端给服务端发一个SYN报文,并指明客户端的初始化序列号ISN。此时客户端处于SYN_SENT状态。
- 2. 第二次握手:服务器收到客户端的SYN报文之后,会以自己的SYN报文作为应答,并且也指定了自己的初始化序列号ISN(s)。同时会把客户端的ISN+1作为ACK的值,表示自己已经收到了客户端的SYN,此时服务器处于SYN_RCVD的状态。在确认报文段中SYN=1,ACK=1,确认号ACK=x+1,初始序号SEQ=y。
- 3. 第三次握手:客户端收到SYN报文之后,会发送一个ACK报文,当然,也是一样把服务器的ISN+1作为ACK的值,表示已经收到了服务端的SYN报文,此时客户端处ESTABLISHED状态。服务器收到ACK报文之后,也处于ESTABLISHED状态。
- 4. 此时,双方已建立起了连接。

TCP 三次握手

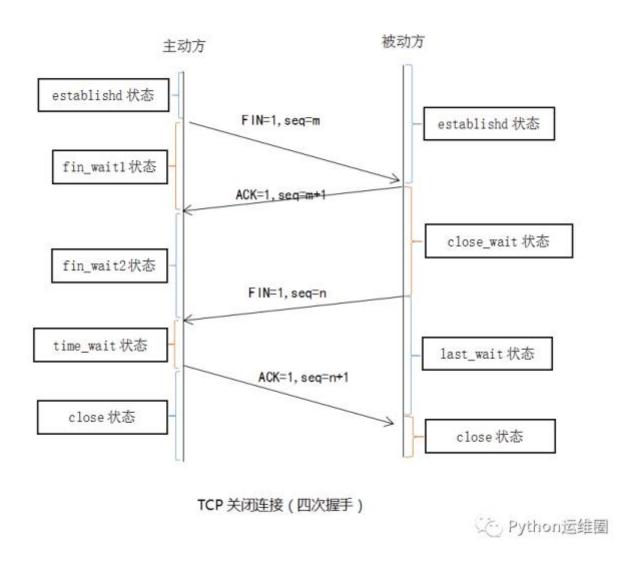

四次挥手断开连接

- 1. 第一次挥手:客户端发送一个FIN报文,报文中会指定一个序列号。此时客户端处于FIN_WAIT1状态。即发出连接释放报文段(FIN=1,序号seq=u),并停止再发送数据,主动关闭TCP连接,进入FIN WAIT1(终止等待1)状态,等待服务端的确认。
- 2. 第二次挥手:服务端收到FIN之后,会发送ACK报文,且把客户端的序列号值+1作为ACK报文的序列号值,表明已经收到客户端的报文了,此时服务端处于CLOSE_WAIT状态。即服务端收到连接释放报文段后即发出确认报文段(ACK=1,确认号ack=u+1,序号seq=v),服务端进入CLOSE_WAIT(关闭等待)状态,此时的TCP处于半关闭状态,客户端到服务端的连接释放。客户端收到服务端的确认后,进入FIN_WAIT2(终止等待2)状态,等待服务端发出的连接释放报文段。
- 3. 第三次挥手:如果服务端也断开连接,和客户端的第一次挥手一样,发给FIN报文,且指定一个序列号。此时服务端处于LAST_ACK的状态。即服务端没有要向客户端发出的数据,服务端发出连接释放报文段(FIN=1, ACK=1,序号seq=w,确认号ack=u+1),服务端进入LAST ACK(最后确认)状态,等待客户端的确认。
- 4. 第四次挥手:客户端收到FIN之后,一样发送一个ACK报文作为应答,且把服务端的序列号值+1作为自己ACK报文的序列号值,此时客户端处于TIME_WAIT状态。需要过一阵子以确保服务端收到自己的ACK报文之后才会进入CLOSED状态,服务端收到ACK报文之后,就处于关闭连接了,处于CLOSED状态。即客户端收到服务端的连接释放报文段后,对此发出确认报文段(ACK=1,

seq=u+1, ack=w+1), 客户端进入TIME_WAIT (时间等待)状态。此时TCP未释放掉,需要经过时间等待计时器设置的时间2MSL后,客户端才进入CLOSED状态。

5. 此时,双方已断开了连接。

2.2 数据传输

发送端和接收端的接收机均采用rdt3.0进行数据传输。

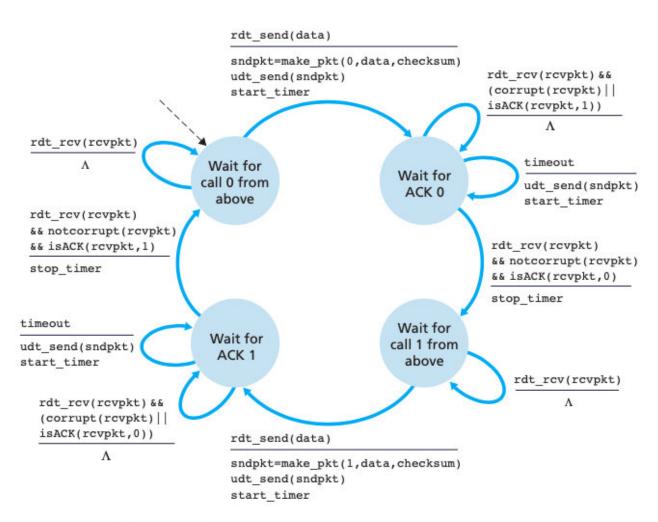

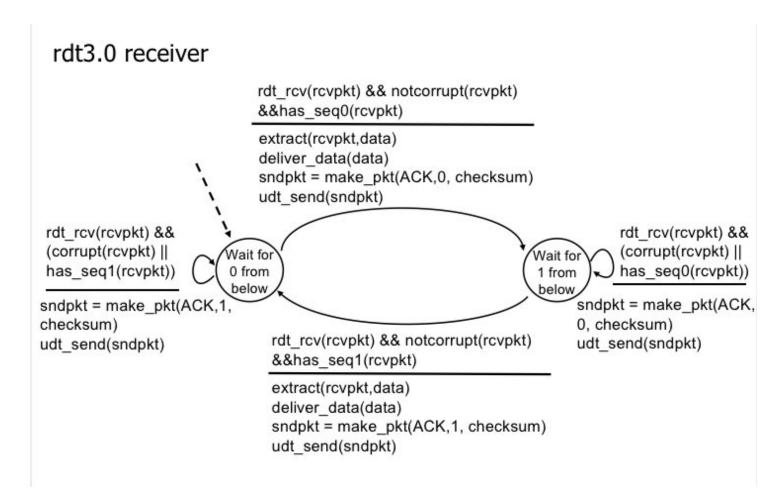

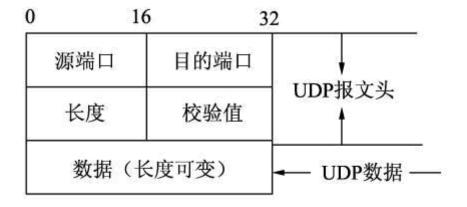

Figure 3.15 • rdt3.0 sender

数据在传输时,将一个文件分为数个包进行分段传输,每个包的内容为数据头+数据。在传输时,需要接受到上一个发送包序号的ACK=1才能发送下一个数据包;接收端接收到了一个数据包,先要进行校验,如果检查无误,则向发送放返回该序列号的ACK=1。在一定时间内,如果没有收到该序列号的ACK=1,将会重新传输该包。如果接收端收到了重复的包裹,则将其中一个丢弃,但仍需要向发送方发送该序列号的ACK=1。在最后,发送方需要向接收端发送一个FIN=1,ACK=1,SYN=1的包裹,表示文件传输结束;接收端收到该包裹后,需要向发送方返回一个ACK=1,表示收到文件传输结束的信号。

三、代码实现

3.1 报文格式

报文头长度为48位

前16位为数据长度,用于记录数据区的大小

17-32位为校验和,用于检验传输的正确性

33-40位为标志位,只使用低3位,分别为FIN,ACK,SYN

40-48位为传输的数据包的序号, 0-255循环使用

```
const int MAXSIZE = 1024;//传输缓冲区最大长度
const unsigned char SYN = 0x1;
                                       //SYN = 1 ACK = 0
                                       //SYN = 0, ACK = 1
const unsigned char ACK = 0x2;
const unsigned char ACK_SYN = 0x3;
                                     //SYN = 1, ACK = 1
const unsigned char FIN = 0x4;
                                      //FIN = 1 ACK = 0
const unsigned char FIN_ACK = 0x6;
                                      //FIN = 1 ACK = 1
const unsigned char OVER = 0x7;
                                      //结束标志
double MAXTIMEOUT = CLOCKS_PER_SEC;//最大时延
#pragma pack(1)
//报文格式
struct HEADER
{
       u_short sum = 0;//校验和 (16位)
       u_short datasize = 0;//数据长度 (16位)
       unsigned char flag = 0;//FIN, ACK, SYN (8位)
       unsigned char seq = 0;//传输序列号 (8位)
       HEADER()
       {
               sum = 0;
               datasize = 0;
               flag = 0;
               seq = 0;
       }
};
#pragma pack()
```

3.2 计算校验和

发送方生成检验和

- 1. 发送方将发送的进行检验和运算的数据分成若干个16位的位串,每个位串看成一个二进制数。
- 2. 将首部中的检验和字段置为0, 该字段也参与检验和运算。
- 3. 对这些16位的二进制数进行1的补码和运算,累加的结果再取反码即生成了检验码。将检验码放入检验和字段中。其中1的补码和运算,即带循环进位的加法,最高位有进位应循环进到最低位。

接收方校验检验和

- 接收方将接收的数据(包括检验和字段)按发送方的同样的方法进行1的补码和运算,累加的结果再取 反码。
- 2. 进行校验,如果结果为0,表示传输正确;否则,说明传输有差错。

```
//差错检测: 计算校验和
u_short CheckSum(u_short* message, int size)
{
        int count = (size + 1) / 2;
        u short* buffer = (u short*)malloc(size + 1);
        memset(buffer, 0, size + 1);
        memcpy(buffer, message, size);
        u long sum = 0;
       while (count != 0)
                sum += *buffer;
                buffer++;
                count--;
                if (sum & 0xffff0000)
                        sum &= 0xffff;
                        sum++;
                }
        return ~(sum & 0xffff);
}
```

3.3 建立连接 (三次握手)

服务器端

```
//建立连接
int Connect(SOCKET& sockServ, SOCKADDR IN& ClientAddr, int& ClientAddrLen)
{
       HEADER header;
       char* buffer = new char[sizeof(header)];
       //第一次握手 (接收)
       while (1)
       {
               if (recvfrom(sockServ, buffer, sizeof(header), 0, (SOCKADDR*)&ClientAddr, &Clier
               {
                       cout << 1 << endl;</pre>
                       return 0;
               }
               memcpy(&header, buffer, sizeof(header));
               if (header.flag == SYN && CheckSum((u_short*)&header, sizeof(header)) == 0)
               {
                       cout << "第一次握手成功" << endl;
                       break;
               }
       }
       //第二次握手(发送)
       header.flag = ACK_SYN;
       header.sum = 0;
       header.sum = CheckSum((u_short*)&header, sizeof(header));
       memcpy(buffer, &header, sizeof(header));
       if (sendto(sockServ, buffer, sizeof(header), 0, (sockaddr*)&ClientAddr, ClientAddrLen) =
       {
               return 0;
       clock_t start = clock();//发送时间
       //第三次握手(接收)
       while (recvfrom(sockServ, buffer, sizeof(header), 0, (sockaddr*)&ClientAddr, &ClientAddr
       {
               if (clock() - start > MAXTIMEOUT)
               {
                       header.flag = ACK_SYN;
                       header.sum = 0;
                       header.sum = CheckSum((u_short*)&header, sizeof(header));
                       memcpy(buffer, &header, sizeof(header));
                       if (sendto(sockServ, buffer, sizeof(header), 0, (sockaddr*)&ClientAddr,
                               return 0;
                       cout << "第二次握手超时, 正在重传" << endl;
               }
       cout << "第二次握手成功" << endl;
       HEADER temp_header;
```

客户端

```
int Connect(SOCKET& socketClient, SOCKADDR_IN& servAddr, int& servAddrlen)
{
       HEADER header;
       char* buffer = new char[sizeof(header)];
       //第一次握手(发送)
       header.flag = SYN;
       header.sum = 0;
       header.sum = CheckSum((u_short*)&header, sizeof(header));
       memcpy(buffer, &header, sizeof(header));
       if (sendto(socketClient, buffer, sizeof(header), 0, (sockaddr*)&servAddr, servAddrlen) =
       {
               return 0;
       //cout << "第一次握手成功" << endl;
       clock t start = clock();
       //设置为非阻塞的socket
       u long mode = 1;
       ioctlsocket(socketClient, FIONBIO, &mode);
       //第二次握手(接收)
       while (recvfrom(socketClient, buffer, sizeof(header), 0, (sockaddr*)&servAddr, &servAddr
       {
               if (clock() - start > MAXTIMEOUT)//超时, 重新传输第一次握手
                       header.flag = SYN;
                       header.sum = 0;
                       header.sum = CheckSum((u_short*)&header, sizeof(header));
                       memcpy(buffer, &header, sizeof(header));
                       sendto(socketClient, buffer, sizeof(header), 0, (sockaddr*)&servAddr, se
                       start = clock();
                       cout << "第一次握手超时, 正在重传" << endl;
               }
       cout << "第一次握手成功" << endl;
       memcpy(&header, buffer, sizeof(header));
       if (header.flag == ACK_SYN && CheckSum((u_short*)&header, sizeof(header)) == 0)
       {
               cout << "第二次握手成功" << endl;
       else
       {
               cout << "连接发生错误! " << endl;
               return 0;
       }
       //第三次握手(发送)
       header.flag = ACK;
       header.sum = 0;
       header.sum = CheckSum((u_short*)&header, sizeof(header));
       if (sendto(socketClient, (char*)&header, sizeof(header), 0, (sockaddr*)&servAddr, servAc
```

3.4 断开连接 (四次挥手)

服务器端

```
int DisConnect(SOCKET& sockServ, SOCKADDR_IN& ClientAddr, int& ClientAddrLen)
{
       HEADER header;
       char* buffer = new char[sizeof(header)];
       //第一次挥手(接收)
       while (1)
       {
               if (recvfrom(sockServ, buffer, sizeof(header) + MAXSIZE, 0, (sockaddr*)&ClientAc
               {
                       return 0;
               }
               memcpy(&header, buffer, sizeof(header));
               if (header.flag == FIN && CheckSum((u_short*)&header, sizeof(header)) == 0)
               {
                        cout << "第一次挥手成功" << endl;
                       break;
               }
       }
       //第二次挥手(发送)
       header.flag = ACK;
       header.sum = 0;
       header.sum = CheckSum((u_short*)&header, sizeof(header));
       memcpy(buffer, &header, sizeof(header));
       if (sendto(sockServ, buffer, sizeof(header), 0, (sockaddr*)&ClientAddr, ClientAddrLen) =
       {
               return 0;
        }
       //第三次挥手(发送)
       header.flag = FIN_ACK;
       header.sum = 0;
       header.sum = CheckSum((u_short*)&header, sizeof(header));
       memcpy(buffer, &header, sizeof(header));
       if (sendto(sockServ, buffer, sizeof(header), 0, (sockaddr*)&ClientAddr, ClientAddrLen) =
       {
               return 0;
       clock_t start = clock();
       //第四次挥手(接收)
       while (recvfrom(sockServ, buffer, sizeof(header), 0, (sockaddr*)&ClientAddr, &ClientAddr
               if (clock() - start > MAXTIMEOUT)
               {
                       header.flag = ACK;
                       header.sum = 0;
                       header.sum = CheckSum((u_short*)&header, sizeof(header));
                       memcpy(buffer, &header, sizeof(header));
                       if (sendto(sockServ, buffer, sizeof(header), 0, (sockaddr*)&ClientAddr,
```

```
{
                              return 0;
                      header.flag = FIN_ACK;
                      header.sum = 0;
                      header.sum = CheckSum((u_short*)&header, sizeof(header));
                      memcpy(buffer, &header, sizeof(header));
                      if (sendto(sockServ, buffer, sizeof(header), 0, (sockaddr*)&ClientAddr,
                              return 0;
                      cout << "第二/三次挥手超时,正在重传" << endl;
               }
       }
       cout << "第二次&第三次挥手成功" << endl;
       HEADER temp_header;
       memcpy(&temp_header, buffer, sizeof(header));
       if (temp_header.flag == ACK && CheckSum((u_short*)&temp_header, sizeof(temp_header)) ==
       {
               cout << "第四次挥手成功" << endl;
       }
       else
       {
               cout << "连接发生错误! " << endl;
               return 0;
       }
       cout << "四次挥手结束,连接断开" << endl;
       return 1;
}
```

客户端

```
int DisConnect(SOCKET& socketClient, SOCKADDR_IN& servAddr, int& servAddrlen)
{
       HEADER header;
        char* buffer = new char[sizeof(header)];
        //第一次挥手(发送)
        header.flag = FIN;
        header.sum = 0;
        header.sum = CheckSum((u_short*)&header, sizeof(header));
        memcpy(buffer, &header, sizeof(header));
        if (sendto(socketClient, buffer, sizeof(header), 0, (sockaddr*)&servAddr, servAddrlen) =
        {
               return 0;
        clock t start = clock();
        u long mode = 1;
        ioctlsocket(socketClient, FIONBIO, &mode);
        //第二次挥手(接收)
L: while (recvfrom(socketClient, buffer, sizeof(header), 0, (sockaddr*)&servAddr, &servAddrlen)
{
        if (clock() - start > MAXTIMEOUT)
        {
                header.flag = FIN;
                header.sum = 0;
               header.sum = CheckSum((u_short*)&header, sizeof(header));
               memcpy(buffer, &header, sizeof(header));
                sendto(socketClient, buffer, sizeof(header), 0, (sockaddr*)&servAddr, servAddrle
                start = clock();
                cout << "第一次挥手超时, 正在重传" << endl;
        }
}

       cout << "连接发生错误! " << endl;
       return 0;
}
//第四次挥手(发送)
header.flag = ACK;
header.sum = 0;
header.sum = CheckSum((u_short*)&header, sizeof(header));
if (sendto(socketClient, (char*)&header, sizeof(header), 0, (sockaddr*)&servAddr, servAddrlen) =
{
       return 0;
}
cout << "第四次挥手成功" << endl;
cout << "四次挥手结束,连接断开" << endl;
return 1;
}
```

3.5 数据传输

服务器端 (接收)

```
int ReceiveMessage(SOCKET& sockServ, SOCKADDR_IN& ClientAddr, int& ClientAddrLen, char* message)
{
       HEADER header;
        int FileLen = 0;
        char* buffer = new char[MAXSIZE + sizeof(header)];
        int seq = 0;
       while (1)
        {
                int len = recvfrom(sockServ, buffer, sizeof(header) + MAXSIZE, 0, (sockaddr*)&Cl
                memcpy(&header, buffer, sizeof(header));
                if (header.flag == OVER && CheckSum((u_short*)&header, sizeof(header)) == 0)//判
                        cout << "文件接收成功" << endl;
                        break;
                }
                if (header.flag == unsigned char(0) && CheckSum((u_short*)buffer, len) == 0)
                {
                        if (seq != int(header.seq))//判断是否接受的是别的包
                                //返回ACK
                                header.flag = ACK;
                                header.datasize = 0;
